ROLL IT

We have a block that looks like the digit 6:

Place this block onto the shaded area of the plan. Then, move the block by rolling it. In each step you can rotate the entire block by 90 degrees in one of the four cardinal directions. For example, if you roll the block downwards from its origin, the entire block will stand on the first three cells of the sixth row of the puzzle. The block can never leave the grid (not even partially), and it must never stand directly on any of the banned black cells.

The goal is to make the block touch the bottom right corner cell. At the end, the block may stand on any of its six sides and it may be rotated arbitrarily.

The puzzle below has a unique shortest solution that requires just 8 moves. Can you find it?
